

## Safe-T-Stop Testimonial

Bridgestone – Belconnen, Phillip and Tuggeranong

To whom it may concern:

Our multi-site group recently reviewed our equipment, procedures, training and policies with regard to brake testing across our sites. We identified a need to improve and tighten our approach to how we conducted brake testing on our customers vehicles. We recognise the importance of regular and effective brake testing!

We reviewed a range of solutions available in the market place to try and determine the best approach to brake testing and what options we had to provide other services to our customers.

Initially we were sceptical and had some reservations on many of the solutions available but in the end we settled on the Safe-T-Stop PlateTronic test lane as the best approach.

Part of the reason for this selection was the comprehensive test result Safe-T-Stop provides. We can now test and measure the brake performance on each individual wheel as well as brake imbalances left to right and front to rear! This is an effective brake test.

Safe-T-Stop not only provides the brake tester but also includes an alignment check, suspension tester and a corner weighbridge – all in one solution.

I'm pleased to say our reservations have been completely put to rest and we have put a Safe-T-Stop test lane in to three of our locations.

I have no hesitation in recommending a Safe-T-Stop test lane to any workshop that understands the importance of regular and effective brake testing!

Best Regards
